

SAP BTP Workshop series

The SAP Business Technology Platform, or SAP BTP for short, offers you a wide range of possibilities and resources. We show you how to make the most of this potential for your own requirements.

To help you maintain an overview and create an optimal foundation for your business processes, our experts introduce you to the possibilities of SAP BTP. Depending on your needs, we focus specifically on areas that are relevant to you. Upon request, we will accompany you as you take your first steps with SAP BTP. Our experienced team of experts will support you – ensuring that your introduction to SAP BTP is successful and future-proof.

Based on our experience, we have developed various workshop formats to accompany you on your journey to SAP BTP. We also offer individually tailored training courses and workshops – please feel free to contact us.

- ✓ **Basics Workshop SAP BTP**
- ✓ **Deep Dive SAP Integration Suite**
- ✓ **Deep Dive SAP Build**
- ✓ **Development Workshop SAP BTP**

Basics Workshop SAP BTP

To better understand the possibilities and relevance of the SAP Business Technology Platform (SAP BTP), this initial overview provides the ideal introduction to our workshop series. You will learn how to obtain specific information in order to evaluate and scale individual components.

After covering the general basics, we will take a closer look at the structural design of the platform and develop a structure tailored to your needs. This includes the logical structure of the system landscape as well as the design of users, roles, and permissions. This ensures that security-related aspects are taken into account at an early stage – so that you can scale your applications securely and sustainably right from the start.

Before you get to gain your first hands-on experience with the system, you will gain insight into the core areas of SAP BTP. Our experts will introduce you to the possibilities in application development, automation, integration, analytics, and AI. They will also evaluate the relevance of the individual possibilities for your company.

At the end of the workshop, you will be ready to set up SAP BTP in a structured manner and integrate it into your system landscape.

Workshop content:

- Strategic positioning within the SAP ecosystem
- Introduction to the SAP Discovery Center, including insight into licensing models
- Setting up the account structure (global accounts, directories, and subaccounts)
- Users, roles, and permissions
- Overview of the possibilities offered by SAP BTP
- Insight into the core areas of SAP BTP
- Evaluation of the components relevant to your company

Your benefits:

- ✓ Confidence through a well-founded strategic foundation
- ✓ Scalability through future-oriented system design
- ✓ Reduced training costs through focus on relevant areas
- ✓ High speed of innovation through access to expert knowledge

Create with Confidence

Deep Dive: SAP Build

There are various ways to differentiate your company from the competition: one key lever for this is the individual design and adaptation of business processes. With SAP Build, SAP now enables so-called “citizen developers” to make adjustments that go beyond the familiar customizing options – without any “pro code development knowledge.”

Building on the SAP BTP basics workshop or existing know-how in your company, our experts will guide you through the functionalities of SAP Build. The focus here is again on the functionalities relevant to your company and your users.

To get you started, we provide you with basic knowledge and use cases that you can use to select the appropriate approach for your use cases. The goal is to optimally integrate your own applications into your system landscape so that end users can seamlessly incorporate them into their daily work.

In addition to the possibilities of creating your own applications, the integration of existing applications into automated processes is also part of this workshop. The aim here is to increase efficiency and reduce the workload for users.

At the end of the workshop, participants will have a uniform knowledge base for building their own scalable and future-proof applications and automated processes.

Workshop content:

- Presentation of the basics of SAP Build and SAP Build Work Zone
- Introduction to SAP’s design and integration specifications with a focus on site menus, workpages, workspaces, and application integration
- Getting started with SAP Build Apps
- Getting started with SAP Build Process Automation

Your benefits:

- ✓ Workload reduction in the pro-code development team
- ✓ Increased efficiency in processing thanks to automated processes
- ✓ Uniformly designed applications with an optimized user interface
- ✓ Time savings in app development

Deep Dive: Integration Suite

The success of an application increasingly depends on its integration into various systems. Whether it is a standard SAP solution, a third-party solution, or an in-house development, the benefits that can be realized depend heavily on the interaction with the existing system landscape. That is why this workshop takes an in-depth look at the possibilities offered by the SAP Integration Suite, which plays a key role in this interaction.

The workshop focuses on SAP Cloud Integration, which forms the central basis for all integration scenarios. You will learn how to use predefined integrations from SAP and develop your own integration scenarios. This allows you to get started quickly and meet individual requirements. We will introduce you to the monitoring options so that you can ensure the secure operation of your system landscape.

Building on this, you will learn about the possibilities of API management, trading partner management, event mesh, and open connectors. With this knowledge, the system architects involved are prepared for all integration scenarios and can implement the appropriate approach for the respective requirement.

We work with you to develop integration patterns that meet your requirements using the Integration Advisor component and based on proven best practices. This allows us to select the right integration approach for each requirement and implement it efficiently.

After the Deep Dive Integration Suite session, you will be able to implement integration scenarios independently.

Workshop content:

- Overview of SAP Integration Suite as part of SAP BTP
- Insight into the components of the suite, i.e. cloud integration, API management, Event Mesh, trading partner management as well as Integration Advisor
- Getting started with SAP Standard Content
- Development of use cases for procedure selection

Your benefits:

- ✓ Know-how enhancement for your integration team
- ✓ Quick use of predefined integrations
- ✓ Efficient creation of custom integrations through system-supported selection of the procedure
- ✓ Improvement of automation options through comprehensive integrations
- ✓ Resilient system architecture through well-founded decisions and strong foundations

From Idea to Impact

Development Workshop

SAP BTP

No training can fully replace practical experience – and the first steps are often the hardest. This is where our SAP BTP development workshop comes in. In addition to deepening your knowledge of specific content, our experienced developers will assist you in implementing your first development project.

Prerequisites are basic development skills within the team and a specific statement of work. We start the workshop with a deep dive into the components and functionalities required for your use case. This creates a solid foundation and ensures that all participants are familiar with the relevant terminology and concepts.

The core focus is on the development and go-live of the application by your development team. Our experts provide support and guide the team step by step through the development process. Our experts provide best practices. This reduces the likelihood of errors and increases the speed of development.

By accompanying the development process, your development team's reservations about the new solution are significantly reduced. Our team of experts can point out stumbling blocks based on your experience. This saves you time and allows you to benefit from the experience in later developments.

At the end of the workshop, you will have your first self-developed solution at your disposal. With the support of our experts, you will receive a scalable and future-proof solution. Your team will get a quick introduction to the development possibilities of SAP BTP and can use this as a basis to develop their own efficient applications.

Workshop content:

- DeepDive sessions in use case-specific functionalities
- Support of your own development team by experienced developers
- Best practices of application development and security
- Individual application based on SAP BTP for a company-specific use case

Your benefits:

- ✓ Cost savings in onboarding through focused training
- ✓ Faster development through best practices
- ✓ Lower error rate through expert support
- ✓ Rapid skill development within the team through practical knowledge sharing
